

# 1 Thu

## A Bash

- a) A little bit of Bash each day keeps the doctor away. In the main loop, around line 140, we have

```
read -p "Starting generation ${gen} at location ${state}.\n      Press any key to continue... " -n1 -s
```

Option `-p <prompt>` outputs the **prompt** string before reading user input.

Option `-n <number>` returns after reading the specified **number** of chars.

Option `-s` does not echo the user's input.

## 2 Fri

*On a flight home. Didn't do much except started going over Part B1 again*

### 3 Sat

#### A Meeting with Julie

- a) The meeting this Wednesday was cancelled. In the meantime, Julie suggests reading the Appendix and her candidacy paper. I have largely finished reading the relevant part of the Appendix, so the rest of this week will most likely be spent reading the candidacy paper and checking out the **Loop Parts** in more detail.
- b) Part B1 second pass: will also check out the job submission script this time around (final line of **Part\_B\_GPU\_job\_1.sh**, but still not going to look into the xmacros).

#### B Regex

- a) Started reading about regular expression, although perhaps not directly relevant to anything.
